#neoicecream

TASTY IS HEALTHY. HEALTHY IS TASTY.

Investor Presentation

Proven product. Untapped U.S. category. Scalable manufacturing platform.

Functional symbiotic frozen dessert | U.S. manufacturing launch

Investment thesis

Validated concept | U.S. whitespace | Manufacturing upside

Proven product

The concept has already been commercialized in Russia, with real sales, a working formulation, a developed flavor line, and brand / packaging direction.

Untapped U.S. category

In the U.S., the product can enter as a differentiated functional frozen dessert positioned at the intersection of taste, wellness, and modern food logic.

Scalable platform

The project is not just a single SKU. It is a launch of dedicated production on leased premises with room for brand expansion plus private label / contract manufacturing.

VALIDATION

What has already been validated

Existing commercialized SKUs provide visual proof that the product has already been produced, packaged, and sold in a prior market.

Why these visuals matter

- Real product line previously commercialized in Russia
- Multiple consumer-ready SKUs, not a one-off prototype
- Supports prior sales evidence and flavor hierarchy
- Demonstrates tangible execution before U.S. launch

Suggested caption in the main deck:

Commercialized product line previously sold in Russia

Raspberry

Pistachio

Chocolate

Vanilla

What has already been validated

The project is beyond the idea stage. Several key building blocks already exist.

- Commercial sales recorded across multiple SKUs in Russia
- Customer feedback and product acceptance already exist
- Working formulation and process know-how already developed
- Flavor line, release formats, and packaging direction already defined
- Preliminary U.S. manufacturing model and 24-month ramp already built
- Patent protection exists in Russia; U.S. filing pathway is being prepared

2025 sales mix leader

Raspberry

52.1% of 2025 units in ABC report

2026 sales mix leader

Raspberry

70.7% of Jan-Apr 2026 units

Investor ask

$1.40M

Modeled 24-month funding need

Monthly EBITDA at 50t

$348k

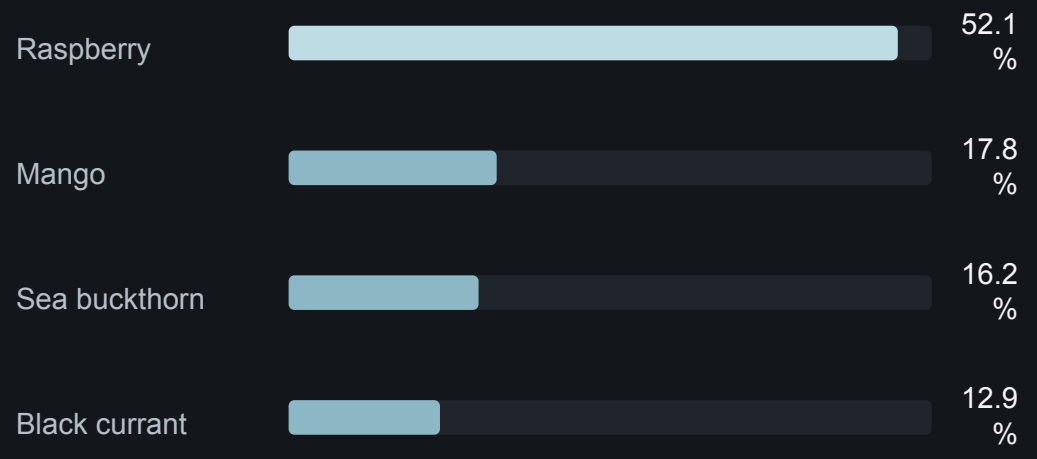
Steady-state model output

Validation in this deck is anchored in user-provided evidence: sales, product concept, operating know-how, and financial modeling — not only in narrative claims.

Sales proof: clear SKU hierarchy already emerged

The portfolio is not selling evenly — which is useful. It reveals where the launch should focus first.

2025 sales mix



2025 units visible in ABC report: 111,940 raspberry; 38,240 mango; 34,900 sea buckthorn; 27,800 black currant.

2026 sales mix (Jan 1 – Apr 14)

Interpretation for launch planning: start with a hero SKU, then layer strong secondaries rather than launch every flavor equally.

What the product is

#neoicecream is a cultured frozen dessert of symbiotic type: probiotic cultures plus inulin in a frozen, indulgent consumer format.

Taste-led delivery

A true frozen dessert experience rather than a medicinal product. The product competes on consumer appeal, not only on formulation.

Functional logic

Probiotic cultures and inulin create the product's symbiotic logic; the frozen matrix is positioned as a practical and differentiated delivery format.

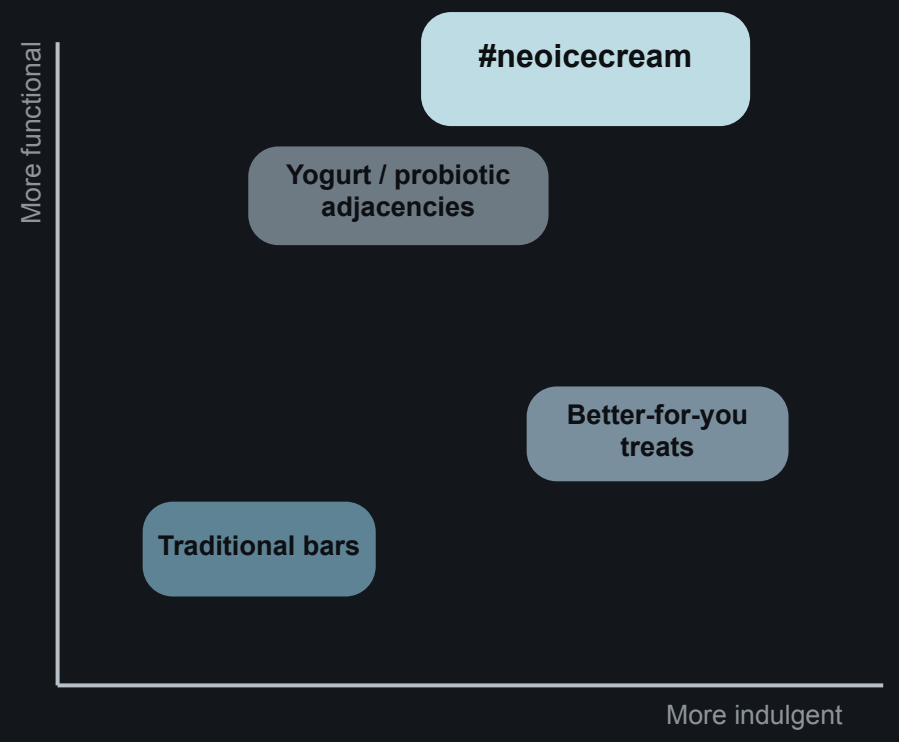
Commercial relevance

The concept supports a branded line first and can later support private label / contract manufacturing at the same facility.

Why the U.S. opportunity exists

This slide is intentionally qualitative for the draft: it frames strategic whitespace without over-claiming market data.

Category whitespace map



- The concept can be framed in the U.S. as a differentiated frozen dessert rather than as a copy of the Russian line.
- The goal is to enter where indulgence, better-for-you expectations, and functional food logic intersect.
- The draft deck does not depend on broad market statistics yet; it is built around a sharper strategic positioning story.

Market scale context: a 50 t/month launch is still a small entry point

Publicly sourceable 2025 U.S. retail scan data; state-level California retail cuts were not found in open sources.

2025 U.S. retail dollars

Retail category snapshots from Circana coverage reported by Dairy Foods

*Frozen dessert subset = ice milk/frozen dairy desserts + sherbet/sorbet/ices + frozen yogurt/tofu

#neoicecream launch scale

50 t/month

≈ 600 t/year

At a 70g bar equivalent, that is about 8.6M units per year — a very small share of the U.S. novelty aisle.

Launch-scale implication

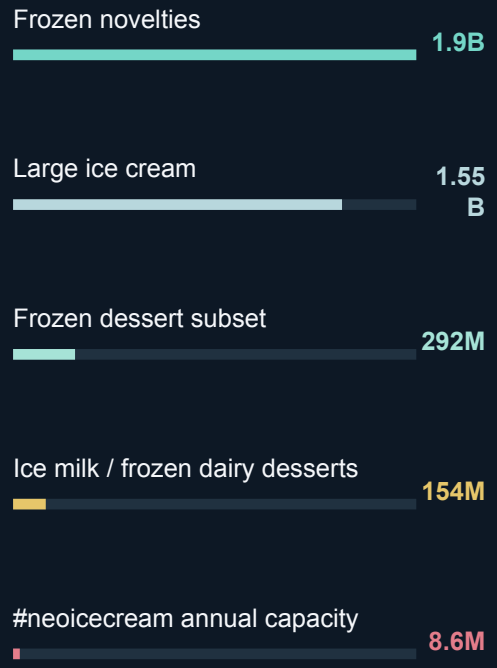
50 t/month works as a realistic starting scale: it equals only 0.45% of U.S. frozen novelty unit sales and ~0.55% of the large ice cream category on a 70g-unit basis.

This is exactly why the modeled capacity is plausible: it does not require winning a large market share to fill the first phase of production.

0.45% of U.S. novelty units

Annual unit context

Our planned capacity vs. public 2025 U.S. unit volumes



Sources (public): Dairy Foods, “Ice cream sees small declines, but ice milk/frozen dairy picks up the slack” (Jan. 6, 2026) and Dairy Foods Magazine, “Market Trends” (March 2026 frozen novelties report).
https://www.dairyfoods.com/articles/98756-ice-cream-sees-small-declines-but-ice-milk-frozen-dairy-picks-up-the-slack | https://digitaledition.dairyfoods.com/march-2026/market-trends/
Capacity comparison uses a 70g bar equivalent (600,000 kg / 0.07 kg ≈ 8.6M units)..

What we are building

The investor is entering a manufacturing business with a branded product line — not merely one frozen SKU.

1. Branded line

Core consumer line under the #neoicecream brand, with launch centered around the strongest initial SKU logic and selected secondary flavors.

2. U.S. production base

Own production on leased premises in the U.S., enabling quality control, margin structure, speed of iteration, and long-term operating independence.

3. B2B upside

The same facility can later support private label and contract manufacturing for interested brands — manufactured in-house, not licensed out.

Manufacturing plan and launch footprint

The operating model is intentionally lean: pilot independently, then launch own production on leased premises.

Plant basis
Leased U.S. facility

Design capacity
50 t / month

Funding peak
Month 4

EBITDA positive
Month 5

Pilot / self-funded phase

Pilot work handled by founders without external factory build-out.

Facility launch

Own production setup on leased U.S. premises rather than greenfield construction.

Ramp

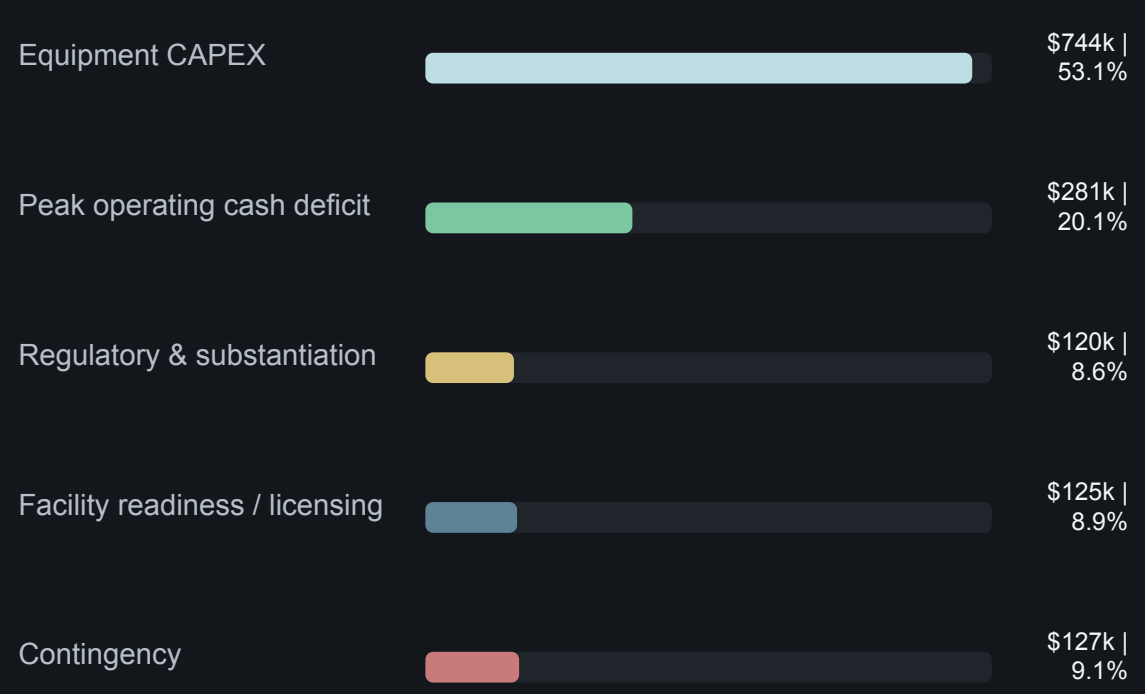
24-month modeled ramp with funding peak in month 4 and monthly EBITDA positive in month 5.

Steady-state

50 t/month design basis with room for brand growth and B2B utilization.

Use of funds

Most of the ask is hard production capability, not soft overhead.



Opening inventory reserve is minor ($3.1k) and omitted from the main graphic for readability.

Recommended investor ask

$1.40M

This level funds the launch through the modeled 24-month ramp with contingency included.

Peak funding month

4

Cash flow positive

Month 8

Draft recommendation for outreach: present the ask first, and discuss structure in follow-up conversations rather than on the first slide.

Team and execution setup

CEO / Co-founder Vagram M.

Drives operations, launch execution, investor process, and day-to-day management.

Co-founder Alexander I.

Owns strategy and long-range business direction.

2 food technologists

Currently in Russia; can travel as needed and support production remotely on an ongoing basis.

Current setup

- Lean founder-led structure
- Pilot phase handled without external factory build
- Scale-up supported by technologists and modeled staffing plan

Investor snapshot: capital required and modeled upside at a glance

Condensed figures from the internal operating model for a 50 t/month launch scenario.

Capital required

$1.40M

Modeled funding needed to launch U.S. production on leased premises.

Equipment	$744k
Working capital gap	$281k
Regulatory / substantiation	$120k
Facility readiness	$125k
Contingency	$127k

Use of funds shown in summary form only.

What the model indicates

Headline operating outputs from the current base case.

Launch scale
50 t/month
≈ 600 t/year planned capacity

Year 1 revenue
$5.31M
Modeled first full-year sales

Year 1 EBITDA
$1.23M
Modeled first full-year EBITDA

Year 2 revenue
$11.43M
Modeled second full-year sales

Year 2 EBITDA
$4.18M
Modeled second full-year EBITDA

Steady-state EBITDA
$348k/mo
At 50 t/month run-rate

Why this matters for a busy investor

Base case

A relatively modest initial raise is modeled to unlock branded production, a 50 t/month operating base, and a path from $5.31M Year 1 revenue to $11.43M Year 2 revenue.

The next step is not more theory. It is manufacturing launch capital.

Draft outreach ask

$1.40M

to launch #neoicecream production in the U.S. on leased premises and fund the modeled ramp.

This is a draft investor deck. Next iteration should add: refined U.S. market evidence, sharper launch-channel plan, and a cleaner appendix with full model assumptions.
